

LivePanel Update Download and Install

To install the latest Live Panel application simply requires replacing the LivePanel.exe file in the BlueLite X1 directory [typically "C:\Program Files (x86)\BlueLite X1"]. Occasionally Windows requires the correct administrator rights to copy to the new file to the BlueLite X1 directory.

As is good practice whenever making changes, before starting you can rename the current LivePanel.exe program to LivePanelBAK.exe (or whatever name you're comfortable using) to avoid name confusion when copying the new LivePanel.exe.

When you download the LivePanel update, save the file (LivePanel.exe) to your local disk drive. (Make sure you remember to what folder it downloaded.)

Once you've saved it, you can copy it to the "C:\Program Files (x86)\BlueLite X1" directory. Windows will typically inform you that you need Administrator Permission to move to that folder.

You should now be able to simultaneously connect to the Live Panel using multiple mobile devices running iPanel.
